

Are you interested in helping us further our understanding of people's perceptions of asthma using an innovative method – drawings?

If so, you are invited to take part in a research study exploring the use of drawings to further understanding of people's perceptions and experiences of their asthma.

An emerging approach for investigating patient perspectives of illness is the use of drawings. Despite the high prevalence of asthma in Australia, there is yet to be research using drawing to explore adult's perceptions and experiences of their asthma in the Australian population. Drawings may be useful for expression and could increase our understanding of the perspective of people living with asthma.

This study is being conducted by researchers from the University of Sydney. You will be asked to complete a survey, a spirometry reading, an interview and a drawing activity. This will be conducted in one sitting and in-person with a researcher. The total time commitment is expected to be approximately one hour. You will be reimbursed for your time.

You can take part in this study if you are over 18 years of age and have been told by your doctor that you have asthma.

If you would like more details or would like to take part, please contact the researchers (details below). Thank you!
